Centre and Item Master: Reference

Centre Master and Item Master share one catalogue. A requirement line is the same record whether you open it from a location or from an item.

Centre hierarchy

- Locations are organised as Centre, SubCentre, and Point. Each location has a unique badge code and, where applicable, a parent centre.
- The hierarchy is a reporting structure, not a stock transfer path. Moving stock between locations still needs a receipt and a dispatch.
- Open a centre to see its children and every catalogue item it tracks.

Requirement lines

- Each location tracks the shared catalogue with a required quantity and an on-hand quantity.
- Required quantities differ by location; the same item can need one unit at a point and several at a centre.
- Requirements are master data. Day-to-day stock changes update on-hand quantities, not the requirement.

Coverage and status

- Covered: on hand meets or exceeds the requirement.
- Short: on hand is greater than zero but below the requirement.
- Missing: on hand is zero while the requirement is greater than zero.
- Shortfall is the requirement minus on hand, never less than zero.

Reading health

- A location is Critical when any line is missing, Needs stock when any line is short, and Ready when every line is covered.
- An item view aggregates the same lines across all locations, so the two masters always agree.
- Use the shortfall total to prioritise replenishment, then open the location or item for the detail.
